The present peptide is the complementarity determining region 1 (CDR1) from the heavy chain variable region of the reshaped human monoclonal antibody (MAD) H225, which is specific for the human epidermal growth factor (EGF) receptor. The MAD, or a fragment, can be used to inhibit the growth of tumour calls, especially late stage prostatic tumour cells in humans, optionally conjugated a cytotoxic agent, especially doxorubicin, taxol or cisplatin, or a signal transduction, ras or cell Claim 1; Page 83; 112pp; English.

The invention relates to a method for inhibiting the growth of tumours in human patients by treating with an effective amount of a combination of radiation and a non-radiolabelled protein receptor tyrosine kinase (PRTK) inhibitor, the overexpression of which can lead to tumourigenesis. The method can be used in the treatment of tumours of e.g. breast, lung, colon, kidney, bladder, head and neck, ovary, prostate or brain. The administration of a suitable antibody to the patient makes the tumour more susceptible to radiotherapy
                                                                                                                                                                                                                 Hypervariable region; complementarity determining region; CDR; tumour; single chain antibody; growth inhibitor; human; tumourigenesis; therapy; protein receptor tyrosine kinase; heavy chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Treatment of human tumors, using a combination of radiation and a non-radiolabeled protein receptor tyrosine kinase inhibitor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention relates to a method for inhibiting the growth of factor receptor (EGFR) in human parients. The method involves treating the patient with a combination of EGFR/human EGF-1 (HER1) antegonist, optionally with a chemotherapeutic agent or radiation. The antagonist can be for example a chimeric anti-EGFR monoclonal antibody, C255. The EGFR/HER1 antagonist is useful for inhibiting the growth of refractory tumours such as tumours of breast, heart, lung, small intestine, colon, spleen, kidney, bladder, head and neck, ovary prostate, brain, pancreas, skin, bone, bone marrow, blood, thymus, uterus, testicles, cervix and liver, preferably squamous cell carcinomas. The present sequence represents the heavy chain variable region complementarity determining region 1 amino acid sequence of the chimeric anti-EGFR monoclonal antibody C225 which is used in an example illustrating the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Epidermal growth factor receptor/human epidermal growth factor receptor-1 antagonist for inhibiting the growth of refractory tumors.
                                                                                                            Refractory tumour growth inhibition; epidermal growth factor receptor; BGFR antagonist; cancer; squamous cell carcinoma; anti-EGFR antibody; complementarity determining region; CDR.
                                                    Anti-EGFR monoclonal antibody H chain V region CDR1 peptide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Mouse heavy chain hypervariable region (CDR1) of 225 antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Length 5;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                     of a member of the EGF receptor family, or a combination of the antiagonist and photocherapy, chemotherapeutic agent or radiation therapy. The antibody used in the method of the invention acts as an epidermal growth factor receptor (EGFR) antagonist by inhibiting EGFR /HERI phosphorylation. The method of the invention is useful for traating a mammal with hyperproliferative disease such as psoriasis, actinic keratoses, seborrheic keratoses, warts, keloid scars and cacama signilated by a ligand of a member of the EGF family of receptor. This sequence represents the murine anti-EGF 255 antibody heavy chain (VH) hypervariable region (CDR1) used as an inhibitor of EGFR in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human, TANGO, INTERCEPT, secreted polypeptide; immune disorder;

                                                                                                                                                                                                                                                             Treating a mammal with hyperproliferative disease especially psoriasis, stimulated by ligand of member of epidermal growth factor family of receptors, by administering antagonist of the receptor.
                                                                                                                                                                                                                                                                                                                                       This invention relates to a novel method for treating a mammal with hyperproliferative disease stimulated by a ligand of a member of the epidermal growth factor (BGF) family of receptors. The method involves administering an antibody or a defective receptor that is an antagonist
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
epidermal growth factor; EGF; psoriasis; actinic keratosis; seborrheic keratosis; warts; keloid scars; eczema; 255 antibody; hypervariable region; CDR1; EGFR inhibitor.

The invention relates to secreted polypeptide-related proteins and nucleic acids (TANGO and INTERCEPT proteins and nucleic acids). The nucleic acids, proteins and antibodies specific to the proteins are uncleic acids, proteins and antibodies specific to the proteins are useful in screening assays, predictive medicine (e.g. diagnostic assays, prognostic assays monitoring clinical trials and pharmacogenetics) and thorapeutic methods. The sequences are used in classification problems proliferative disorders (e.g. andithiple sclerosis or lupus), neurological disorders (e.g. multiple) sclerosis or lupus), neurological disorders (e.g. disorders (e.g. multiple) sclerosis or lupus), neurological disorders (e.g. propolated electrosis or lupus), neurological disorders (e.g. thrombotycopenia or anaemia) and disorders cinvolving blood vessels (e.g. atherosclerosis or vasculitis). The nucleic acids may also be used in chromosome mapping, tissue typing and forensic polypeptide-related peptide of the invention. Note: The sequence data for this patent was obtained in electronic format directly from USPTO at sequence.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New nucleic acid molecule encoding a secreted protein (e.g. TANGO 202, TANGO 201, TANGO 201 or INTERCEPT 217), useful for diagnosing, preventing or treating disorders such as cancer, diabetes or atherosclerosis, and in forensic biology.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        arnes TM, Sharp JD, Kirst SJ, Myers PS, Leiby KR;

                                                                                                                                                                                                                                                                                                                                               The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a polypeptide encoded by a full length human cDNA of the invention. Note: The sequence data for this patent did form part of the printed specification, but was obtained in CD-ROM format directly from EPO
                                                                                                                                                                                                                                                                                                   830 Primers useful for synthesizing full length cDNA clones and their use

The variable region (AAMO5823) of the humanised IDIO antibody heavy chain (AAMO5829) consists of human IC4 heavy chain variable region framework (substd. at 9 positions with mouse or consensus human amino acids) and complementarity determining regions from the murine IDIO antibody specific for a 28/32 kDa heterodimeric antigen present on the surface of malignant B-cells. It can be coexpressed with humanised IDIO light chain (see also AAWO5828) in e.g. mouse myelome NSO cells. Humanised antibody fragments can be incorporated into novel bispecific antibodies reactive Walth both effector cell antigens (see also AAWO5820) and malignant B-cells. (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New bi-specific antibody reactive with both T or NK cells and malignant foels - also their humanised forms and hybridomas producing them, useful for treating or preventing leukaemia, lymphoma and myeloma.

```

·. The present sequence is the heavy chain variable region of the reshaped human monoclonal antibody (MAD) #225, 225RHD. The MAD is specific for the human epidermal growth factor (EGF) receptor. The MAD, or a fragment, can be used to inhibit the growth of tumour cells, especially late stage prostatic tumour cells, especially late stage agent, especially doxorubicin, taxol or cisplatin, or a signal transduction, ras or cell cycle inhibitor Gaps ·.                                     AAW08952
                                                  The present sequence is the heavy chain variable region of the reshaped human monoclonal antibody (MAD) H255, 225RH. The MAD is specific for the human monoclonal growth factor (EGF) receptor. The MAD, or a fragment, can be used to inhibit the growth of tumour cells, especially late stage agent tumour calls in humans, optionally conjugated to a cytotoxic agent, especially doxorubicin, taxol or cisplatin, or a signal transduction, ras or cell cycle inhibitor

The MAb is specific for the human epidermal growth factor (EEF) receptor. The MAb, or a fragment, can be used to inhibit the growth of tumour cells, especially late stage prostatic tumour cells in humans, optionally conjugated to a cytotoxic agent, especially doxorubicin, taxol or cisplatin, or a signal transduction, ras or cell cycle inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Chimeric and humanised versions of anti-EGF receptor antibody 225 - used for inhibiting tumour growth, esp. of late stage prostatic tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  .,

The MAD is specific for the human monoclonal growth factor (EGF) receptor. The MAD, or a fragment, can be used to inhibit the growth of tumour cells, especially late stage spotsatic tumour cells in humans, optionally conjugated to a cytotoxic agent, especially doxorubicin, taxol or displatin, or a signal transduction, ras or cell cycle inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Chimeric and humanised versions of anti-EGF receptor antibody 225 - used for inhibiting tumour growth, esp. of late stage prostatic tumour.

The MAb is specific for the human epidermal growth factor (EGF) receptor. The MAb, or a fragment, can be used to inhibit the growth of tumour cells, especially late stage prostatic tumour cells, especially conjugated to a cytotoxic agent, especially doxorubicin, taxol or cisplatin, or a signal transduction, ras or cell cycle inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               - nseq

The present invention describes a monoclonal antibody (MAD) (I) that binds to a human breast cancer antigen that is also bound by MAD 454C11 and 520C9 (produced hybridoma ATCC HB8484 and HB8696, respectively). Also described is a hybridoma that produces (I). (I) is useful in specific binding assays, affinity purification, drug or toxin targeting, imaging, and genetic or immunological therapeutics for various cancers. The present sequence represents a VH domain derived from a 260F9 hybridoma, which is used in the exemplification of the present invention

New elongase polypeptides which are functional long chain polyunsaturated fatty acid (PURA) elongase polypeptides are described. The elongase catalyses an elongase reaction to produce PURA (24 carbon fatty acid with at least 4 double bonds) such as di-homo-gamma-linoleic acid (20:3Delta8,11,14), arachidonic acid (20:4Delta5,8,11,14), elocosapentanoic acid (20:5Delta8,11,14), docosatetraenoic acid (22:3Delta3,16,19), docosatetraenoic acid (22:4Delta7,10,13,16,19), bufA produced is useful in foodsutffs, dieta7y supplements and in pharmaceutical compositions which can then be used to elavate PURA levels of an animal or plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel isolated polypeptide comprising functional long chain polyunsaturated fatty acid (PUFA) elongase of Caenorhabditis elegans used to produce PUFA for foodstuff, dietary supplement or pharmaceutical
                                                                                                            Elongase; polyunsaturated fatty acid; PUFA; dietary supplement; pharmaceutical; foodstuff; food; di-homo-gamma-linoleic acid; arachidonic acid; elcosapentanoic acid; docosatrienoic acid; docosatetraenoic acid; docosapentaenoic acid; docosabentaenoic ac
                                    Human sequence (BAC207d4) related to PUFA elongase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         100.0%; Score 31; DB 3; I

Totalation, characterization, and N-terminal

Bur. J. Blochem. 154:153-159(1986).

L. FUNCTION: Component of the cuticale of migratory locust which

contains more than 100 different structural proteins.

L. DOMAIN: The tetrapeptide (A-A-P-[AV]) repeats found throughout the

protective envelope of other species.

Protective envelope of other species.

C. ISIMILARITY: Contains 1 cuticle consensus domain.

PROSTIS: S06038.

PROSTIS: PRO00479; CUTICLE:

Nucletc Acids Res. 13:8587-8661(1985).
PUNCTION: Encodes an essential ribose methyltransferase that specifically modifies to 2'-O-methylguanosine a universally conserved nucleotide, G-2270, in the peptidyl transferase center of the mitochondrial large ribosomal RNA (218). This modification seems to be important for the normal accumulation of this latter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SGD; S0005727; PET56.

"The globular head domain of titin extends into the center of the sarcomeric M band. cDNA cloning, epitope mapping and immunoelectron microscopy of two titin-associated proteins.";

J. Cell Sci. 106:319-330(1993).

-!- FUNCTION: Major component of the vertebrate myofibrillar M band. Binds myosin, titin, and light meromyosin. This binding is dose
                                                                                                                                                                                                                                                                                                                                                                                                                                Ide protein, Thick filament, Repeat.

    J. Bacteriol. 183:3293-3302(2001).
    I-PUNCTION: Upptake of uric acid.
    SUBCELLULAR LOCATION: Integral membrane protein (Probable).
    INDUCTION: Expression is very low in excess nitrogen (glutamate plus ammonia) and is induced during limiting-nitrogen conditions (glutamate). Expression is further induced when allantoin or uric acid are added during limiting-nitrogen conditions.
    SIMILARITY: BELONGS TO THE XANTHINE/URACIL PERMEASES FAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              01-FEE-1996 (Rel. 33, Created)

-- DISEASE: Defects in SALl is the cause of Kallmann syndrome 1
-- KALL) [MIM: 308700], also abbreviated KS. KALL is a genetic
disorder that associates hypogonadotropic hypogonadism and
anosmia. In this disease, the normal embryonic migration of GNRH-
synthesizing neurons from the olfactory placodes to the
hypothalamic region as well as the axonal extension of olfactory
neurons cowards the forebrain are impaired.
-- SIMILARITY: Contains 1 WAP-type domain.
J. Clin. Endocrinol. Metab. 83:1650-1653(1998).
-!- FUNCTION: May be an adhesion-like molecule with anti-protease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (POTENTIAL)

Ferric reductase of Saccharomyces cerevisiae: molecular
characterization, role in iron uptake, and transcriptional control by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                J. Inorg. Biochem. 47:249-255(1992).
-!- FUNCTION: Reductase activity that acts on ferric iron chelates external to the cell. Plays a role in iron uptake. May participate in the transport of electrons from cytoplasm to an extracellular substrate (ferric ion) via FAD and heme intermediates. May also participate in Cu(II) reduction and Cu(I)

-!- COFACTOR: FAD (Probable).
-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- INDUCTION: BY IRON DEPRIVATION. REPRESSED BY IRON UPTAKE.
-!- SIMILARITY: Belongs to the FRE / CYBB family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CHARACTERIZATION.

Whith E., May be a trans-acting factor involved in the development
and maintenance of the mammalian nervous system. Transactivates
the promoter of its own gene (By similarity).
C. I. SUBUNIT: Efficient DNA binding requires dimerization with another
DHIH Protein (By similarity).
C. I. SUBUNIT: Lacquence differs (Probable).
C. I. SUMILARITY: Contains I basic helix-loop-helix (bhiH) domain.
C. I. CAUTION: Ref. I sequence differs from that shown due to frameshifts
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 14, Application US/08483749A

Patent No. 6054561

CENERL INFORMATION:
APPLICANT: RING, DAVID B.
TITLE OF INVENTION: ANTIGEN-BINDING SITES OF ANTIBODY
TITLE OF INVENTION: MOLECULES SPECIFIC FOR CANCER ANTIGENS
NUMBER OF SEQUENCES: 33
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                               Sequence 4, Application US/08397411

Patent No. 6129914

Patent No. 6129914

FARERIA INFORMATION:

GENERAL INFORMATION:

APPLICANT: Weiner, George

APPLICANT: Gingrich, Roger

APPLICANT: TSO, Yun

APPLICANT: TSO, Yun

TITLE OF INVENTION: Bispecific Antibody Effective to Treat

TITLE OF INVENTION: B-Cell Lymphoma and Cell Line

NUMBER OF SEQUENCE: 14

CORRESPONDENCE ADDRESS:

ADDRESSEE: Townsend and Townsend and Crew

STREET: One Market Plaza, Steuart Tower, Suite 2000

CITY: San Francisco

STREET: California

COUNTRY: USA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      100.0%; Score 31; DB 4; Length 265; 100.0%; Pred. Patent No. 6617156
GENERAL INFORMATION:
APPLICANT: Lynn Doucette-Stamm et al
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO
TITLE OF INVENTION: ENTEROCOCCUS PAECALIS FOR DIAGNOSTICS AND THERAPEUTICS
FILE REPRENCE: 032796-032
CURRENT APPLICATION NUMBER: US 60/059,778
PRIOR APPLICATION NUMBER: US 60/055,778
NUMBER OF SEQ ID NOS: 6812

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Notes to the chain V region (3381) - rabbit (fragment)
C;Species: Oryctolagus cuniculus (domestic rabbit)
C;Accession: A01953
R;Margolies, M.N.; Cannon III, L.E.; Strosberg, A.D.; Haber, E.
Proc. Natl. Acad. Sci. US.A. 72, 2180-1284, 1975
A;Title: Diversity of light chain variable region sequences among rabbit antibodies elic A;Reference number: A93799; MUID:75176905; PMID:1094456
A;Accession: A01953
A;Accession: A01953
A;Accession: A01953
A;Residues: 1-92 cMAR>
C;Comment: This chain was obtained from antibody to type III pneumococci and was isolate C;Comment: This chain heterotetramer subunit consists of two identical light (kap hain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into la C;Superfamily: immunoglobulin vegion; immunoglobulin homology ciMM>
F;23-88/Disulfide bonds: #status predicted
